Hydrazine sulfate is not an approved cancer treatment. It has been shown to increase the incidence of some cancers.

Hydrazine sulfate is a chemical used in industrial manufacturing of agricultural chemicals and rocket fuel. Supporters make the false claim that hydrazine sulfate limits the ability of tumor cells to make glucose, an important source of their energy, from body stores. In theory, this would also prevent the accelerated breakdown of protein that causes wasting in patients with advanced cancer. However this effect, or that it could slow tumor growth, has never been shown in humans. Furthermore, hydrazine sulfate has been shown to increase the incidence of breast, lung, liver, and skin cancers.

Hydrazine sulfate is commercially available in the US, but it is illegal to use it as a cancer therapy. It is classified as a potential carcinogen by the Department of Health and Human Services.

## What are the potential uses and benefits?

- To prevent wasting, maintain weight, and increase appetite in patients with advanced cancer  
There is no scientific evidence to support this use.
- To treat cancer  
Clinical trials do not support this use, and one actually showed that hydrazine sulfate was worse than no treatment at all.

## What are the side effects?

- Nausea
- Itching
- Dizziness

- Sedation
- Nerve damage
- Low blood sugar
- Insomnia

#### Case reports

- Isolated cases of liver and kidney failure and brain damage.
- Multiple basal cell carcinomas following extensive exposure to hydrazine sulfate.
- Acute liver injury following brief occupational exposure of only 30 seconds.

If you have questions or concerns, contact your healthcare provider. A member of your care team will answer Monday through Friday from 9 a.m. to 5 p.m. Outside those hours, you can leave a message or talk with another MSK provider. There is always a doctor or nurse on call. If you're not sure how to reach your healthcare provider, call 212-639-2000.
