About Your Sentinel Lymph Node Biopsy

This information explains your sentinel (SEN-tih-nul) lymph node biopsy at Memorial Sloan Kettering (MSK).

You may have this procedure if you have breast cancer or melanoma (a type of skin cancer). It will help your doctor see if cancer cells have spread beyond the tumor to your lymph nodes.

About your lymphatic system and lymph node locations in your body

Your lymphatic (lim-FA-tik) system has 2 main jobs:

- It helps fight infection.
- It helps drain fluid from areas of your body.

Your lymphatic system is made up of lymph nodes, lymphatic vessels, and lymphatic fluid (see Figures 1 and 2).

- **Lymph nodes** are small, bean-shaped glands found along your lymphatic vessels. Lymph nodes filter your lymphatic fluid, taking out bacteria, viruses, cancer cells, and other waste products.
  - A **sentinel lymph node** is the first lymph node that cancer cells often
spread to. This means it’s the first lymph node a tumor drains into. Sometimes, there can be more than 1 sentinel lymph node that a tumor drains into. A sentinel lymph node is also called a sentinel node.

- **Lymphatic vessels** are tiny tubes (like your blood vessels) that carry lymphatic fluid to and from your lymph nodes.

- **Lymphatic fluid** is the clear fluid that travels through your lymphatic system. It carries cells that help fight infections and other diseases.

About your sentinel lymph node biopsy

A sentinel lymph node biopsy is a surgical procedure. During your biopsy, your surgeon will find your sentinel lymph node(s) and take them out. Then, they will send the sentinel lymph node sample to a lab to be checked for cancer cells.

If you’re only having a sentinel lymph node biopsy, your procedure will take
about 30 minutes. However, many people have the biopsy during their breast or melanoma surgery. If this is the case, your surgery will take longer than 30 minutes. Your healthcare provider will tell you what to expect.

**Before your sentinel lymph node biopsy**

Before your biopsy, read *Getting Ready for Surgery* ([www.mskcc.org/pe/getting_ready_surgery](http://www.mskcc.org/pe/getting_ready_surgery)). It explains how to get ready for your biopsy. Your nurse will give you this resource.

**The day of your sentinel lymph node biopsy**

When it’s time for your procedure, you will get anesthesia (medication to make you sleep).

Once you’re asleep, the first thing your surgeon will do is find your sentinel lymph node(s). To do this, they will inject a small amount of blue dye near the site of the tumor. The dye will travel in your lymphatic fluid to your sentinel lymph node(s). It will stain your sentinel lymph node(s) blue.

Once your surgeon finds the area with your sentinel lymph node(s), they will make an incision (surgical cut). The sentinel lymph node(s) will be blue from the blue dye, allowing your surgeon to see them. They will take out the blue sentinel lymph node(s) and send them to the Pathology Department right away. A pathologist is a doctor who uses a microscope to diagnose disease. They will look at the sentinel lymph node sample under a microscope to check for cancer cells.

If the pathologist does not see any cancer cells, the cancer probably has not spread. Your surgeon will not take out any more lymph nodes.

If the pathologist sees cancer cells, this means there’s a higher chance the cancer has spread. You may need to have more lymph nodes taken out and checked for cancer cells. Your surgeon can do this during your biopsy or in a follow-up procedure called a lymph node dissection (dy-SEK-shun). If a lymph node dissection is needed, your surgeon will talk with you about it in
After the biopsy, your surgeon will close your incision(s) with sutures (stitches) under your skin. They may place Steri-Strips™ (thin pieces of surgical tape) or Dermabond® (surgical glue) over your incision(s). They may also cover your incision(s) with a bandage.

**After your sentinel lymph node biopsy**

You may go home the same day as your biopsy, or you may need to stay in the hospital. This depends on how many other surgeries you had that day. Your healthcare provider will tell you what to expect.

Once you’re home, read *Caring for Yourself After Your Sentinel Lymph Node Biopsy* ([www.mskcc.org/pe/caring_after_sentinel_node_biopsy](http://www.mskcc.org/pe/caring_after_sentinel_node_biopsy)). It gives information about what to expect after your biopsy and explains how to care for yourself.

**Radiation safety**

After your biopsy, there will be a very small amount of radiation coming from your body. The amount is so small you do not need to follow any radiation precautions (safety measures).

This means it’s safe to be around other people right after your biopsy, including pregnant people and children. You can spend time near others, and can kiss, hug, hold, and touch them. You can also go back to doing your normal activities right away.

Some security equipment (such as at airports or outside tunnels) can detect (find) very small amounts of radiation. A staff member will give you a wallet card that says you had radioactive medicine. This card says you may give off small amounts of radiation for up to 3 days after your biopsy. Show this card to law enforcement if they stop you at a checkpoint.
Stop breastfeeding for 24 hours
Stop breastfeeding for 24 hours (1 day) after your biopsy. You can keep pumping your milk, but do not feed it to your baby. Throw it away. After 24 hours, you can start breastfeeding again.

If you have any questions about radiation safety, call 212-639-7391 Monday through Friday, from 9 a.m. to 5 p.m.

If you have any questions, contact a member of your care team directly. If you're a patient at MSK and you need to reach a provider after 5 p.m., during the weekend, or on a holiday, call 212-639-2000.
