evaluation beyond the PSA test is warranted.

Through a clinical research program based at the John and Maxine Bendheim and Robert Bendheim Prostate Cancer Diagnostic Center and supported by the Sloan Kettering Institute, the research arm of Memorial Sloan Kettering, physicians hope to quantify the risk factors associated with prostate cancer, such as abnormal findings from a rectal examination, family history of the disease, and elevated PSA levels. This vital research will provide important information about treatment options and preventive strategies. In addition, information about your family history will help Memorial Sloan Kettering's genetic counselors to evaluate your cancer risk. This information will also prove valuable to prostate cancer research because it may determine a genetic link between prostate cancer and other cancers in families.
