many parts of the body and it is unclear which location is the primary site.

Every year, hundreds of people with a CUP diagnosis seek treatment at Memorial Sloan Kettering. Our team of experts uses sophisticated imaging technologies, advanced molecular profiling, and other laboratory tests to learn as much as possible about these tumors.

Sometimes, MSK's doctors can determine the primary site through tissue review by expert pathologists, radiology imaging, or molecular testing, such as [MSK-IMPACT™](#).

If the likely primary site is identified, treatment is directed there. For most people with CUP, a primary site of cancer is not identified. For them, our team of pathologists, medical oncologists, surgeons, and radiation oncologists identifies features of each individual tumor to determine the best care plan.
