Doctors perform a clinical trial when they're hopeful the new strategy is more effective than current treatment. Clinical trials may study:

A new medication that has not been tested in patients.

Applying an existing medication in a new way.

Combining 2 or more existing medications that have not been used together.

MSK's kidney cancer team is leading clinical trials to investigate new therapies for people with kidney cancer. All our trials take place in a controlled, safe setting with teams of doctors, nurses, data coordinators, and imaging experts to make sure patients gain the best possible benefit as they participate in research studies. Researchers follow strict rules to make sure that clinical trials are as safe as possible.

Our group has led many clinical trials that resulted in medications being approved for use around the world. MSK carries out many clinical trials and is always adding new research studies. At MSK, we give our patients early access to promising new treatment options through these mechanisms. This research adds considerably to the ever-growing portfolio of options we can offer to our patients with kidney cancer.
