We routinely conduct a detailed genetic analysis on the bone marrow samples from all people who are <u>newly diagnosed with MDS</u>. This helps us finetune your prognosis and identify personalized treatments that are tailored to your disease. For example, if you have a mutation in one of the so-called splicing genes, such as *SF3B1 or SRSF2*, you may be a candidate for our ongoing clinical trial of a novel splicing-modulator drug called H3B-8800. It was developed in part by scientists at MSK.

Here you can find a continually updated listing of Memorial Sloan Kettering's current clinical trials for MDS.
