Our team is advancing new approaches to finding and diagnosing and treating ovarian cancer.

To check for ovarian cancer, your doctor will likely perform a pelvic exam to feel for lumps or changes in and around the ovaries, and order additional tests if you've been experiencing persistent abdominal bloating, discomfort or other [symptoms](#) , or if you have [risk factors for ovarian cancer](#) .

Women found to have a suspicious mass or other indication of ovarian cancer should see an [ovarian cancer specialist](#) , ideally a gynecologic oncologist.

The following tests and procedures can help determine if you have ovarian, fallopian tube, or peritoneal cancer (the peritoneum is a layer of tissue that lines your abdomen). They can also help in determining the [stage of the cancer](#) , and build a [treatment](#) plan specifically for you.
